

Annual Percentage Rate (APR)

1. **Annual Percentage Rate (APR)** is the annual cost of credit to the borrower which includes Interest Rate, and all other charges associated with the loan or credit facility. APR can be calculated based on the applicable rate of interest and charges/ fee applicable (net of any taxes).
2. **Understanding APR vs. Interest Rate**

The **Interest Rate** is the annual cost of borrowing on a loan amount. In contrast, the **APR** includes not only the Interest Rate but also other costs such as origination fees and additional charges. As a result, APR gives a more accurate and comprehensive view of the total cost of the loan over its full term. This makes APR a valuable tool for comparing loan offers and understanding the true financial commitment involved.

3. **How to Calculate APR**

- a) To calculate the Annual Percentage Rate (APR), consider both the interest rate and any associated fees (net of any taxes) on a loan or credit product. The formula to calculate APR is: $APR = [((Interest + Fees) / Loan Amount) / Number of Days] * 365 * 100$.

- b) **APR can be computed by using the following formula in excel sheet:-**

$$=RATE(A,PMT(B/12,A,C),(C-D))*12$$

A= tenure (months) B= Rate of Interest C= Loan amount

D= Loan Origination Charges (Including Processing Fee, Insurance and other charges for loan processing)
